

Power Management Unit Total Power Solution for SSD

General Description

The RT5086D is a total power management solution for SSD (Solid State Drive) and applicable the dedicated powered by 3.3V or 5V input. The RT5086D provides six step-down converters, is designed to be flexible PMIC for supporting different output load applications with regulated power sequence.

The RT5086D provides configurable outputs for core power of SSD controller, NAND Flash memory, I/O power and DRAM power. It supports dynamic voltage scaling by a dedicated I²C interface and also apply low power mode to minimize the standby power consumption.

Applications

- Solid State Devices

Ordering Information

RT5086D
 └ Package Type
 WSC : WL-CSP-56B 3.19x3.59 (BSC)

Note :

Richtek products are :

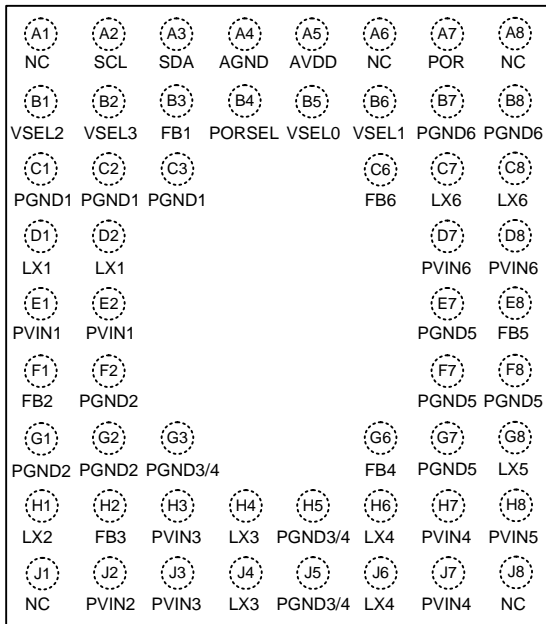

- ▶ RoHS compliant and compatible with the current requirements of IPC/JEDEC J-STD-020.
- ▶ SuiTable for use in SnPb or Pb-free soldering processes.

Features

- Supply Input Voltage Range : 2.9V to 5.5V
- Six High Efficiency, Low Voltage Buck Converters
 - ▶ Up to 85% Efficiency at 10mA, and at Half Rated Output Current
 - ▶ CH1 : 2.3V to 3.45V in 50mV Step, Output 4A Max.
 - ▶ CH2 : 0.9V to 1.575V in 25mV Step & 1.8V, Output 1A Max.
 - ▶ CH3 : 0.9V to 2.1V in 50mV Step, Output 1.5A Max.
 - ▶ CH4 : 1.1V to 1.65V & 3V to 3.6V in 50mV Step, Output 2A Max.
 - ▶ CH5 : 1.4V to 3.6V in 100mV Step, Output 1A Max.
 - ▶ CH6 : 0.7V to 1.3V in 25mV step, Output 4A Max.
 - ▶ CH2/3 2MHz CH5 1MHz CH6 2.5MHz Default Switching Frequency
 - ▶ 1.1V to 1.65V with 2MHz & 3V to 3.6V with 1MHz Default Switching Frequency (CH4)
 - ▶ 2MHz Default Switching Frequency and Programmable 0.8 to 2.3MHz (CH1)
- VSEL0 & VSEL1 & VSEL2 & VSEL3 for Programmable Default Output Voltage
- Low Power Mode (LPM) for Ultra Low Quiescent Current
- High-Speed I²C Interfaces for Programming Outputs
- POR Threshold Selection and Open-Drain POR Indicator
- Power Sequence Control During Startup
- OVP, UVP, UVLO
- Thermal Shutdown Protection
- CH1/4/5 Bypass Mode & Buck Mode

Pin Configuration

(TOP VIEW)

WL-CSP-56B 3.19x3.59 (BSC)

Marking Information

RT5086DWSC : Product Number
YMDNN : Date Code

Functional Pin Description

Pin No.	Pin Name	Pin Function
A1, A6, A8, J1, J8	NC	No internal connection.
A2	SCL	I ² C interface clock signal.
A3	SDA	I ² C interface data signal.
A4	AGND	Analog ground.
A5	AVDD	Analog power input for control logic.
A7	POR	Power on reset information. When AVDD > V _{PORTH} , POR = high level. When AVDD < V _{PORTH} - 100mV, POR = low level.
B1	VSEL2	Power rails default voltage select pin 2. This pin must be connected to AVIN or Ground externally.
B2	VSEL3	Power rails default voltage select pin 3. Pull down resistance 1.5MΩ typ.
B3	FB1	CH1 buck converter output voltage feedback input.
B4	PORSEL	POR threshold voltage select.
B5	VSEL0	Power rails default voltage select pin 2. Pull down resistance 1.5MΩ typ.
B6	VSEL1	Power rails default voltage select pin 1. Pull down resistance 1.5MΩ typ.
B7, B8	PGND6	CH6 buck converter power ground.
C1, C2, C3	PGND1	CH1 buck Converter Power Ground.

Pin No.	Pin Name	Pin Function
C6	FB6	CH6 buck converter output voltage feedback input.
C7, C8	LX6	CH6 buck converter switched output.
D1, D2	LX1	CH1 buck converter switched output.
D7, D8	PVIN6	CH6 buck converter input.
E1, E2	PVIN1	CH1 buck converter input.
E7, F7, F8, G7	PGND5	CH5 buck converter power ground.
E8	FB5	CH5 buck converter output voltage feedback input.
F1	FB2	CH2 buck converter output voltage feedback input.
F2, G1, G2	PGND2	CH2 buck converter power ground.
G3, H5, J5	PGND3/4	CH3 and CH4 buck converter power ground.
G6	FB4	CH4 buck converter output voltage feedback input.
G8	LX5	CH5 buck converter switched output.
H1	LX2	CH2 buck converter switched output.
H2	FB3	CH3 buck converter output voltage feedback input.
H3, J3	PVIN3	CH3 buck converter input.
H4, J4	LX3	CH3 buck converter switched output.
H6, J6	LX4	CH4 buck converter switched output.
H7, J7	PVIN4	CH4 buck converter input.
H8	PVIN5	CH5 buck converter input.
J2	PVIN2	CH2 buck converter input.

Functional Block Diagram

Operation

The RT5086D provides six synchronous Buck regulators to satisfy the entire power system of SSD. This device can communicate with processors through I²C interface for programming the voltage, monitoring the status, or in/out the power saving mode.

Buck Converter

The RT5086D incorporates six high-efficiency synchronous switching Buck converters that deliver various voltages. CH1 features peak current mode architecture of Buck converter. For preventing the unstable when duty > 50% traditionally, it adds external ramp and compensation to reduce duty cycle perturbation and stabilize the current loop. CH1 can operate up to 100% duty to let the lowest input voltage still maintain the regulator work. And the output voltage will be the lowest input voltage decreases dropout voltage on the resistance of current path. Unlike CH1, the control scheme of other buck converters are constant-on-time current mode for low output voltage, quick transient response. The buck converters have a full set of protection.

Buck Over-Current Protection

The buck converters provides over current protection by detecting low-side MOSFET valley inductor current for CH2 to CH6 and by detection high-side MOSFET peak current for CH1. If the sensed inductor current is over the current limit threshold, the OCP will be triggered. When OCP is tripped, the buck converter will keep the over current threshold level until the over current condition is removed.

Buck Under Voltage Protection

The output voltages are continuously monitored for under voltage protection. If the output voltage falls below 60% of the reference voltage, under voltage protection is triggered and then the high-side and low-side MOSFET will turn off. The UVP circuit will turn off all rails and latched. The way to cancel the latched behavior is to re-give AVDD power of the RT5086D.

Buck Output Over Voltage Protection

The output voltages are continuously monitored for over voltage protection. If the output voltage exceeds 120% of the reference, over voltage protection is triggered and then the high-side and low-side MOSFET will turn off. The power MOS will keep turn off until the over voltage condition is removed.

Over-Temperature Protection

If the temperature of the buck converter is over 150°C, the OTP circuit acts and makes all power rails shutdown. They recover back with power-up sequence when the temperature of PMIC is low to 125°C.

VSEL0, VSEL1, VSEL2, VSEL3

The RT5086D applies twelve set default output voltages for all power rails when the device starts a power up sequence.

PORSEL

PORSEL is a logic pin to select the threshold voltage of AVDD to raise POR signal. If AVDD voltage is over the threshold voltage, the device starts a POR rising function. When set PORSEL = 1, the threshold voltage of AVDD is 3.8V, else the threshold voltage is 2.8V.

POR

POR pin is a signal to inform the system that the power up sequence of the RT5086D is completed. If AVDD voltage is larger than the POR rising threshold voltage, the POR will go high with a timing delay. If AVDD voltage is less than POR falling threshold voltage, the POR falls right away.

Absolute Maximum Ratings (Note 1)

- Supply Input Voltage, AVDD, PVIN1, PVIN2, PVIN3, PVIN4, PVIN5, PVIN6 ----- -0.3V to 6V
- Switch Node Voltage, LX1, LX2, LX3, LX4, LX5, LX6
 - DC----- -0.3V to 6V
 - <50ns----- -2.5V to 9V
- Other Pins----- -0.3V to 6V
- Power Dissipation, P_D @ T_A = 25°C
 - WL-CSP-56B 3.19x3.59 (BSC) ----- 3.84W
- Package Thermal Resistance (Note 2)
 - WL-CSP-56B 3.19x3.59 (BSC), θ_{JA} ----- 26°C/W
- Lead Temperature (Soldering, 10 sec.)----- 260°C
- Junction Temperature----- 150°C
- Storage Temperature Range----- -65°C to 150°C
- ESD Susceptibility (Note 3)
 - HBM (Human Body Model) ----- 2kV

Recommended Operating Conditions (Note 4)

- Supply Input Voltage, AVDD, PVIN1, PVIN2, PVIN3, PVIN4, PVIN5, PVIN6----- 2.9V to 5.5V
- Other Pins, VSEL0, VSEL1, VSEL2, VSEL3, SCL, SDA, PORSEL, POR ----- 0V to 5.5V
- Ambient Temperature Range----- -40°C to 85°C
- Junction Temperature Range ----- -40°C to 125°C

Electrical Characteristics

(AVDD = 3.3V, PVIN = 3.3V, T_A = 25°C, unless otherwise specified)

Parameter	Symbol	Test Conditions	Min	Typ	Max	Unit
PMIC						
AVDD Supply Voltage	V _{AVIN}		2.9	3.3	5.5	V

SDA and SCL Output Low Sink Current		I _{OL}	SDA or SCL Voltage = 0.4V	2	--	--	mA

Note 1. Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions may affect device reliability.

Note 2. θ_{JA} is measured under natural convection (still air) at T_A = 25°C with the component mounted on a high effective-thermal-conductivity four-layer test board on a JEDEC 51-7 thermal measurement standard.

Note 3. Devices are ESD sensitive. Handling precaution recommended.

Note 4. The device is not guaranteed to function outside its operating conditions.

Note 5. Design Guaranteed.

Typical Application Circuit

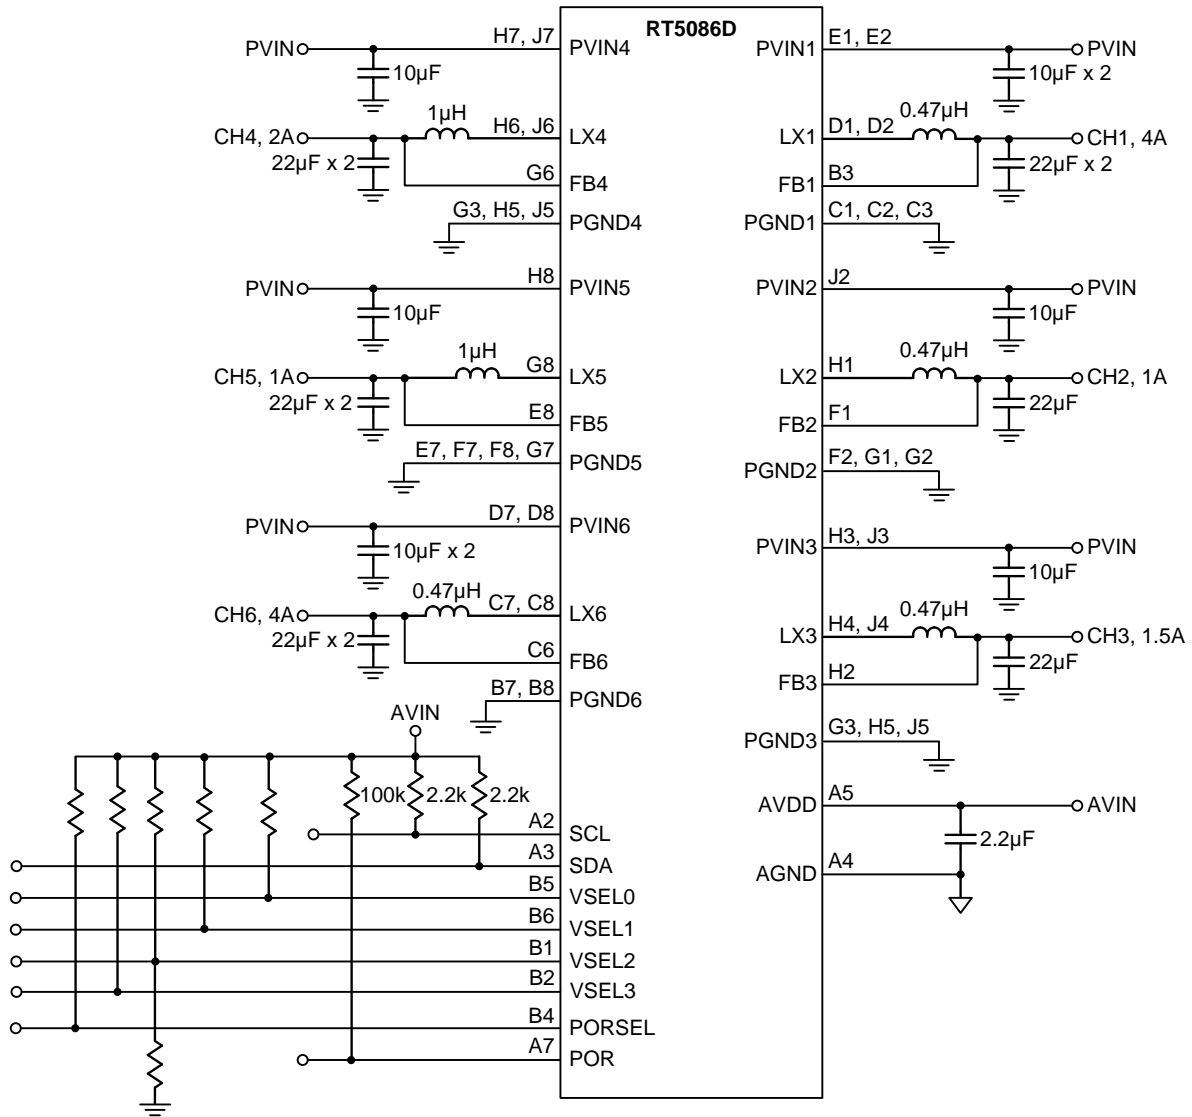

Table 1. Suggested Inductors for Typical Application Circuit

Component Supplier	Part No.	Inductance (µH)	Dimensions (mm)
CYNTEC	PIFE25201T-1R0MS	1	2.5 x 2 x 1
CYNTEC	PIFE25201B-R47MS	0.47	2.5 x 2 x 1.2

Note : VSEL2 Pin must be connected to AVIN or Ground externally.

Typical Operating Characteristics

CH6 Output Voltage vs. Temperature

Functional Register Table

Table 2. RT5086D Register Summary

Name	Type	Register Reset	Address Offset
POWER_GOOD	RO	0x00	0x00
CH1_CFG_REG	RW	0x56	0x01
CH1_SEL_REG	RW	-- (Note 6)	0x02
CH2_CFG_REG	RW	0x55	0x03
CH2_SEL_REG	RW	-- (Note 6)	0x04
CH3_CFG_REG	RW	0x55	0x05
CH3_SEL_REG	RW	-- (Note 6)	0x06
CH4_CFG_REG	RW	0x56	0x07
CH4_SEL_REG	RW	-- (Note 6)	0x08
CH5_CFG_REG	RW	0x56	0x09
CH5_SEL_REG	RW	-- (Note 6)	0x0A
CH6_CFG_REG	RW	0x56	0x0B
CH6_SEL_REG	RW	-- (Note 6)	0x0C
DCDCCTRL0_REG	RW	0x00	0x11
SLEEP_REG	RW	0x00	0x12
DCDCCTRL1_REG	RW	0x00	0x13
DISCHARGE_REG	RW	0xFC	0x14
POR_OPTION_REG	RW	0x00	0x17
DCDCTRL2_REG	RW	--	0x18
WK_TIME1	RW	0x75	0x19
WK_TIME2	RW	0xB9	0x1A
WK_TIME3	RW	0x15	0x1B
VSEL_READ	RO	--	0x1C
PRODUCT_ID_REG	RO	0x86	0x20
MANUFACTURER_ID	RO	0x01	0x21
REVISION_NUMBER	RO	0x00	0x22

Note 6 : Please refer to Table 30 to clarify the default setting of CHx_SEL_REG.

Table 3. POWER_GOOD_REG

Address : 0x00								
Description : Power good information register. When Voltage Rails achieve 90% of VID target, the relative bit will set to 1.								
Bits	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
Name	CH1_PG	CH2_PG	CH3_PG	CH4_PG	CH5_PG	CH6_PG	Reserved	POR
Reset Value	0	0	0	0	0	0	0	0
Read/Write	R	R	R	R	R	R	R	R

Bits	Name	Description
7	CH1_PG	Status bit. Indicates power good on CH1
6	CH2_PG	Status bit. Indicates power good on CH2
5	CH3_PG	Status bit. Indicates power good on CH3
4	CH4_PG	Status bit. Indicates power good on CH4
3	CH5_PG	Status bit. Indicates power good on CH5
2	CH6_PG	Status bit. Indicates power good on CH6
1	Reserved	Reserved bit
0	POR	Status bit. Indicates POR

Table 4. CH1_CFG_REG

Address : 0x01								
Description : CH1 configure register. Set CH1 current limit, VID change slew rate, PWM frequency.								
Bits	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
Name	Reserved	ILMAX		TSTEP		FREQ		
Reset Value	0	1	0	1	0	1	1	0
Read/Write	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bits	Name	Description
7	Reserved	Reserved bit
6 : 5	ILMAX	ILMAX[6:5] = 00 : 3.8A ILMAX[6:5] = 01 : 4.8A ILMAX[6:5] = 10 : 5.8A (default) ILMAX[6:5] = 11 : 6.8A
4 : 3	TSTEP	TSTEP[4:3] = 00 : 20mV/μs TSTEP[4:3] = 01 : 15mV/μs TSTEP[4:3] = 10 : 10mV/μs (default) TSTEP[4:3] = 11 : 5mV/μs
2 : 0	FREQ	FREQ[2:0] = 000 to 010, 0.8MHz FREQ[2:0] = 011, 1.1MHz FREQ[2:0] = 100, 1.4MHz FREQ[2:0] = 101, 1.7MHz FREQ[2:0] = 110, 2.0MHz (default) FREQ[2:0] = 111, 2.3MHz

Table 5. CH1_SEL_REG

Address : 0x02								
Description : CH1 VID setting register.								
Bits	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
Name	Reserved	SEL					Reserved	
Reset Value	0	--	--	--	--	--	0	0
Read/Write	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bits	Name	Description
7	Reserved	Reserved bit
6 : 2	SEL	Supply voltage, SEL[6:2] = 00000 to 00101 : 2.3V SEL[6:2] = 110 : 2.35V SEL[6:2] = 111 : 2.4V SEL[6:2] = 1000 : 2.45V SEL[6:2] = 1001 : 2.5V SEL[6:2] = 1010 : 2.55V SEL[6:2] = 1011 : 2.6V SEL[6:2] = 1100 : 2.65V SEL[6:2] = 1101 : 2.7V SEL[6:2] = 1110 : 2.75V SEL[6:2] = 1111 : 2.8V SEL[6:2] = 10000 : 2.85V SEL[6:2] = 10001 : 2.9V SEL[6:2] = 10010 : 2.95V SEL[6:2] = 10011 : 3V SEL[6:2] = 10100 : 3.05V SEL[6:2] = 10101 : 3.1V SEL[6:2] = 10110 : 3.15V SEL[6:2] = 10111 : 3.2V SEL[6:2] = 11000 : 3.25V SEL[6:2] = 11001 : 3.3V SEL[6:2] = 11010 : 3.35V SEL[6:2] = 11011 : 3.4V SEL[6:2] = 11100 to 11111 : 3.45V
1 : 0	Reserved	Reserved bit

Table 6. CH2_CFG_REG

Address : 0x03								
Description : CH2 configure register. Set CH2 current limit, VID change slew rate, PWM frequency.								
Bits	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
Name	Reserved	ILMAX		TSTEP		FREQ		
Reset Value	0	1	0	1	0	1	0	1
Read/Write	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Application Information

The RT5086D provides six synchronous Buck regulators to satisfy the entire power system of SSD. This device can communicate with processors through

I²C interface for programming the voltage, monitoring the status, or in/out the power saving mode. Table 29 lists the power rails provided by the RT5086D.

Table 29. Detail of Power Rails

Resource Name	Type	Voltage Range	Current Rating
CH1	Buck Converter	2.3V – 3.45V, 50mV step	4000mA
CH2	Buck Converter	0.9V – 1.575V, 25mV step & 1.8V	1000mA
CH3	Buck Converter	0.9V – 2.1V, 50mV step	1.5A
CH4	Buck Converter	1.1V to 1.65V & 3V to 3.6V, 50mV step	2000mA
CH5	Buck Converter	1.4V – 3.6V, 100m step	1000mA
CH6	Buck Converter	0.7V – 1.3V, 25mV step	4A

Buck Converter

The RT5086D incorporates six high-efficiency synchronous switching Buck converters that deliver various voltages. CH1 features peak current mode architecture of Buck converter. For preventing the unstable when duty > 50% traditionally, it adds external ramp and compensation to reduce duty cycle perturbation and stabilize the current loop. CH1 can operate up to 100% duty to let the lowest input voltage still maintain the regulator work. And the output voltage will be the lowest input voltage decreases dropout voltage on the resistance of current path. Unlike CH1, the control scheme of other buck converters are constant-on-time current mode for low output voltage, quick transient response.

Every switching regulator is specially designed for very low quiescent (<35μA), high-efficiency operation throughout the load range. With high switching frequency, the external LC filter can be small and keeps very low output voltage ripple.

Additional features include soft-start, discharge, input UVLO protection, under-voltage protection, over voltage protection, over current protection and over thermal protection. Please note that the IC will latched when one power rail occurs under voltage protection. The other protections just make the rail output voltage drop and recovery when the faults disabled.

With I²C interface, every Buck converter can program output voltage, adjust VID slew rate, change the PWM frequency, and control the on/off state. Even PWM can switch to forced PWM mode, PSKIP mode or LPM (for much less quiescent < 20μA.) There is a limitation that if a buck converter goes to LPM, do NOT load the output current over 15mA or the VOUT would drop low to active UVP protection. Please see the register tables for detail control.

Inductor Selection

For given input voltage (V_{IN}), output voltage (V_{OUT}), and operation frequency (f_{sw}), the inductor value (L) determines the inductor ripple current (ΔI_L) as shown in equation below :

$$\Delta I_L = \frac{V_{OUT} \times (V_{IN} - V_{OUT})}{f_{sw} \times L \times V_{IN}}$$

Having a lower ripple current reduces not only the ESR losses in the output capacitors, but also the output voltage ripple.

A reasonable starting point for selecting the ripple current is ΔI_L = 0.3×I_{MAX} to 0.4×I_{MAX}. The largest ripple current occurs at the highest V_{IN}. To guarantee that the ripple current stays below a specified maximum, the inductor value should be chosen according to the following equation :

$$L = \frac{V_{OUT} \times (V_{IN(MAX)} - V_{OUT})}{f_{sw} \times \Delta I_L \times V_{IN(MAX)}}$$

The current rating of the inductor must be large enough and will not saturate at the peak inductor current (I_{PEAK}):

$$I_{PEAK} = I_{OUT(MAX)} + \frac{\Delta I_L}{2}$$

C_{IN} and C_{sys} Selection

The input capacitance of every rail, C_{IN}, needs to filter the trapezoidal current at the source of the high-side MOSFET. To prevent large ripple voltage, a low ESR input capacitor for the maximum current should be used. The relation between C_{IN} ripple voltage and current ripple is shown as the Figure 1.

Figure 1. Relationship of C_{IN} Voltage Ripple and Current Ripple

The C_{IN} voltage ripple can use below equations to determine when f_{sw} works at CCM mode.

$$V_{CIN_PP} = D \times I_{OUT(MAX)} \times \left(ESR + \frac{(1-D)}{C_{IN} \times f_{sw}} \right)$$

Where $D = V_{OUT} / V_{IN}$. If use MLCC as the input capacitor, the ESR is almost equal to zero. And the minimum input capacitance requirement could be estimate as below :

$$C_{IN(MIN)} = I_{OUT(MAX)} \times \frac{D \times (1-D)}{V_{CIN_PP(MAX)} \times f_{sw}}$$

Next, it needs to consider the input bulk capacitance, C_{sys}, to ensure a stable input voltage during large load transient. The input host supply cannot typically provide the enough input current for the converter to respond to a fast transient current. The input bulk capacitor will provide the energy necessary to source current until the host supply fill the demand, as shown as Figure 2.

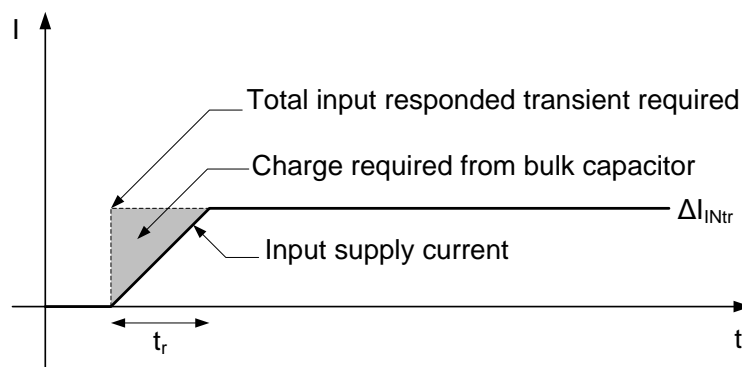

Figure 2. Charge Required from Input Bulk Capacitor During Transient.

Figure 3 shows the diagram of every power rail of the RT5086D sharing a single bank of bulk input capacitors. The total required input transient current due to load

currents of converters could be calculated by using the following equation :

$$\Delta I_{Intr} = \sum_{n=1}^6 \frac{V_{OUTn} \times \Delta I_{OUTn(MAX)}}{V_{IN} \times \eta_n}$$

Where ΔI_{Intr} is the total input transient current required. ΔI_{OUT} is the maximum output transient current. η is the efficiency of the Buck at $I_{OUT(MAX)}$.

Figure 3. The Location of Bulk Input Capacitance Diagram

When ΔI_{Intr} is confirmed, the input bulk capacitance, C_{SYS} , can be decided with following estimating equation:

$$C_{SYS(MIN)} \cong \frac{1.21 \times \Delta I_{Intr}^2 \times L_{IN}}{\Delta V_{INPP(MAX)}^2}$$

where $\Delta V_{INPP(MAX)}$ is the maximum ac voltage allowable. L_{IN} is the input series filter inductance, if not used, put a reasonable value 50nH due to PCB layout.

C_{OUT} Selection

The output capacitor and the inductor form a low pass filter in the buck topology. In steady state condition, the ripple current flowing into/out of the capacitor results in ripple voltage. The output voltage ripple (ΔV_{OUTPP}) can be calculated by the following equation:

$$\Delta V_{OUTPP} = \Delta I_L \left(ESR + \frac{1}{8 \times C_{OUT} \times f_{SW}} \right)$$

When load transient occurs, the output capacitor supplies the load current before the controller can respond. Therefore, the ESR will dominate the output 29 lists the power rails provide by the RT5086D.

voltage sag during load transient. The output voltage under-shoot (V_{SAG}) can be calculated by the following equation :

$$V_{SAG} = \Delta I_{LOAD} \times ESR$$

For a given output voltage sag specification, the ESR value can be determined.

Another parameter that has influence on the output voltage sag is the equivalent series inductance (ESL). The rapid change in load current results in di/dt during transient. Therefore, the ESL contributes to part of the voltage sag. Using a capacitor with low ESL can obtain better transient performance. Generally, using several capacitors connected in parallel can have better transient performance than using a single capacitor for the same total ESR.

Unlike the electrolytic capacitor, the ceramic capacitor has relatively low ESR and can reduce the voltage deviation during load transient. However, the ceramic capacitor can only provide low capacitance value. Therefore, use a mixed combination of electrolytic capacitor and ceramic capacitor to obtain better transient performance.

VSEL0, VSEL1, VSEL2, VSEL3 and PORSEL

The RT5086D applies twenty-four set default output voltages for all power rails when the device starts a power up sequence. The detail of the initial output voltages are shown in Table 30.

PORSEL

PORSEL is a logic pin to select the threshold voltage of AVDD to raise POR signal. If AVDD voltage is over the threshold voltage, the device starts a POR rising function. When set PORSEL = 1, the threshold voltage of AVDD is 3.8V, else the threshold voltage is 2.8V.

POR_OPTION

Please refer to the following table to realize the POR_OPTION setting.

Table 31. POR_OPTION Value Setting Condition

POR_OPTION_REG POR_OPTION_SEL [0:1]	Description
0x00	POR_OPTION = 0
0x01	Reversed.
0x02	POR_OPTION = 0
0x03	POR_OPTION = 1

POR

POR pin is a signal to inform a system that the input voltage is over the AVDD threshold voltage. When the RT5086D detects AVDD > VPORTH with 6ms delay, POR signal would start to raise up. If AVDD voltage is less 100mV than VPORTH, POR signal falls immediately. The POR_OPTION function would affect the POR signal level when the RT5086D works at sleep mode. For POR_OPTION = 1, POR signal would fall immediately when entering sleep mode and it would rise after exiting sleep mode with 6ms delay. For POR_OPTION = 0, POR signal keeps high at sleep mode.

I²C Interface

The RT5086D I²C slave address = 0x1b (hex). I²C interface supports standard slave mode (100kbps), and fast mode (400kbps). The write or read bit stream (N ≥ 1) is shown below :

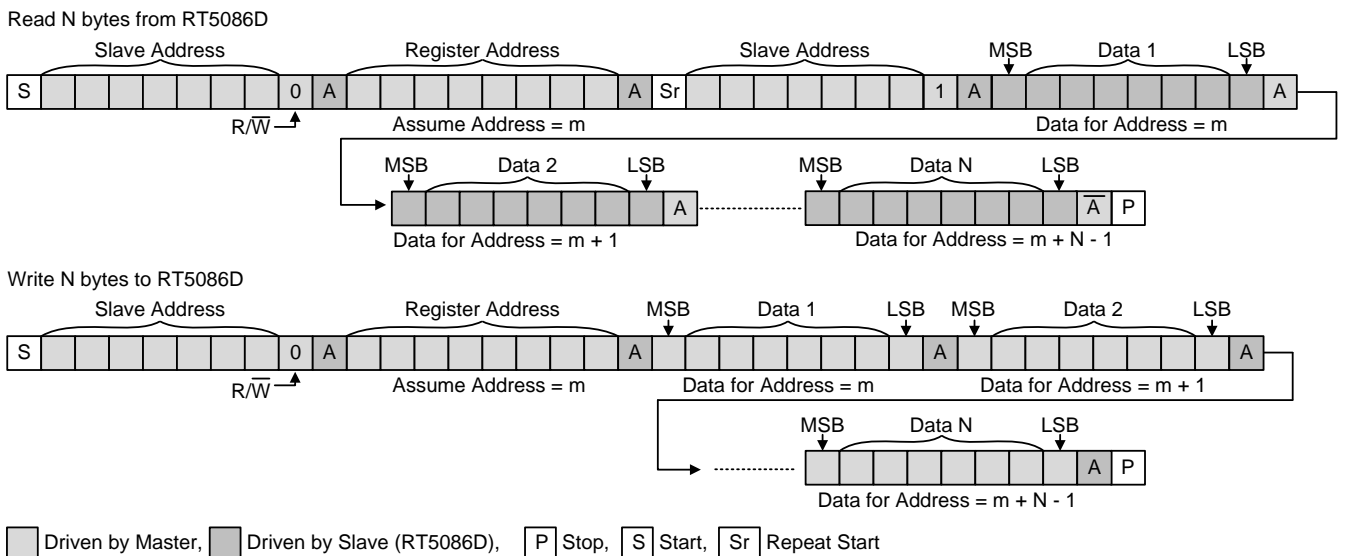

Figure 4. I²C Read and Write Stream and Timing Diagram

Serial Data Transfer Format in Hs-Mode

Serial data transfer format in Hs-mode (high speed mode) meets the Standard-mode I²C-bus specification. Hs-mode can only commence after the following conditions (all of which are in fast mode) :

- ▶ START condition (S)
- ▶ 8-bit master code (00001xxx)
- ▶ not-acknowledge bit (\bar{A})

Figures 5 and Figure 6 show this in more detail. This master code has two main functions:

- ▶ It allows arbitration and synchronization between competing masters at F/S-mode speeds, resulting in one winning master.
- ▶ It indicates the beginning of an Hs-mode transfer.

Hs-mode master codes are reserved 8-bit codes, which are not used for slave addressing or other purposes.

Furthermore, as each master has its own unique master code, up to eight Hs-mode masters can be present on the one I²C-bus system (although master code 0000 1000 should be reserved for test and diagnostic purposes). The master code for an Hs-mode master device is software programmable and is chosen by the System Designer.

Arbitration and clock synchronization only take place during the transmission of the master code and not-acknowledge bit (\bar{A}), after which one winning master remains active. The master code indicates to other devices that an Hs-mode transfer is to begin and the connected devices must meet the Hs-mode specification. As no device is allowed to acknowledge the master code, the master code is followed by a not-acknowledge (\bar{A}).

After the not-acknowledge bit (\bar{A}), and the SCLH line

has been pulled-up to a HIGH level, the active master switches to Hs-mode and enables (at time t_H , see Figure 6) the current-source pull-up circuit for the SCLH signal. As other devices can delay the serial transfer before t_H by stretching the LOW period of the SCLH signal, the active master will enable its current-source pull-up circuit when all devices have released the SCLH line and the SCLH signal has reached a HIGH level, thus speeding up the last part of the rise time of the SCLH signal.

The active master then sends a repeated START condition (Sr) followed by a 7-bit slave address (or 10-bit slave address, see Section 14) with a R/W bit address, and receives an acknowledge bit (\bar{A}) from the selected slave.

After a repeated START condition and after each acknowledge bit (\bar{A}) or not-acknowledge bit (\bar{A}), the active master disables its current-source pull-up circuit. This enables other devices to delay the serial transfer by stretching the LOW period of the SCLH signal. The active master re-enables its current-source pull-up circuit again.

When all devices have released and the SCLH signal reaches a HIGH level, and so speeds up the last part of the SCLH signal's rise time.

Data transfer continues in Hs-mode after the next repeated START (Sr), and only switches back to F/S-mode after a STOP condition (P). To reduce the overhead of the master code, it's possible that a master links a number of Hs-mode transfers, separated by repeated START conditions (Sr).

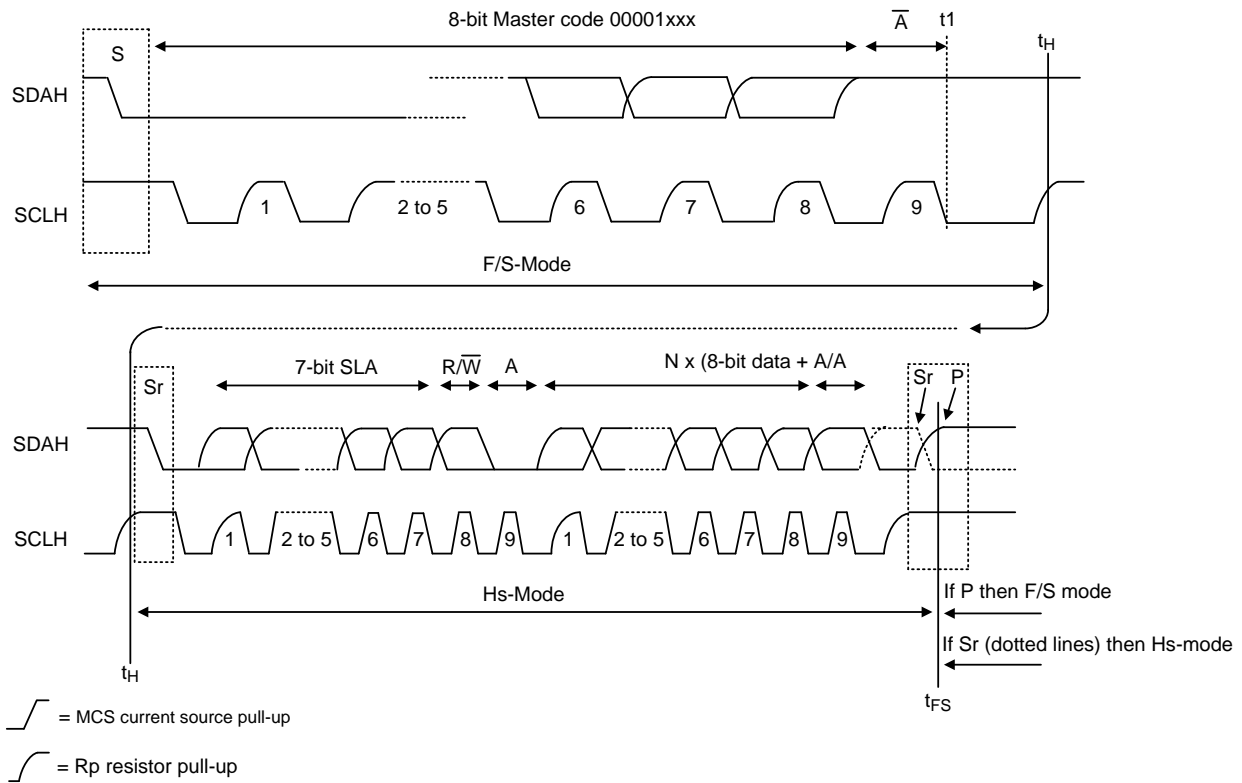

Figure 6. A Complete Hs-mode Transfer

Power On/Off Sequence

The RT5086D starts a power up sequence when AVDD > UVLO rising threshold voltage, and the device shuts down with AVDD < UVLO falling threshold voltage. Please note that when PMIC starts a power up sequence, I²C interface would not work until the total time slots are run out (about 8ms). The RT5086D applies sleep mode of PMIC to save power consumption with setting the SLEEP bit of SLEEP_REG to 1. If the device goes to sleep mode, power rails are set to LPM and the alive rails depend on sleep mode control register setting. The power rails will exit from LPM to normal mode and wake up with a sequence as the same as the power-up-sequence when SLEEP bit = 0. The relations of all power rails of the RT5086D and sleep off / wake up sequence with different POR_OPTION on V_{IN} = 5V are shown as following Figure 7. The relations of all power rails of the RT5086D and sleep off / wake up sequence with different POR_OPTION on V_{IN} = 3.3V are shown as following Figure 8.

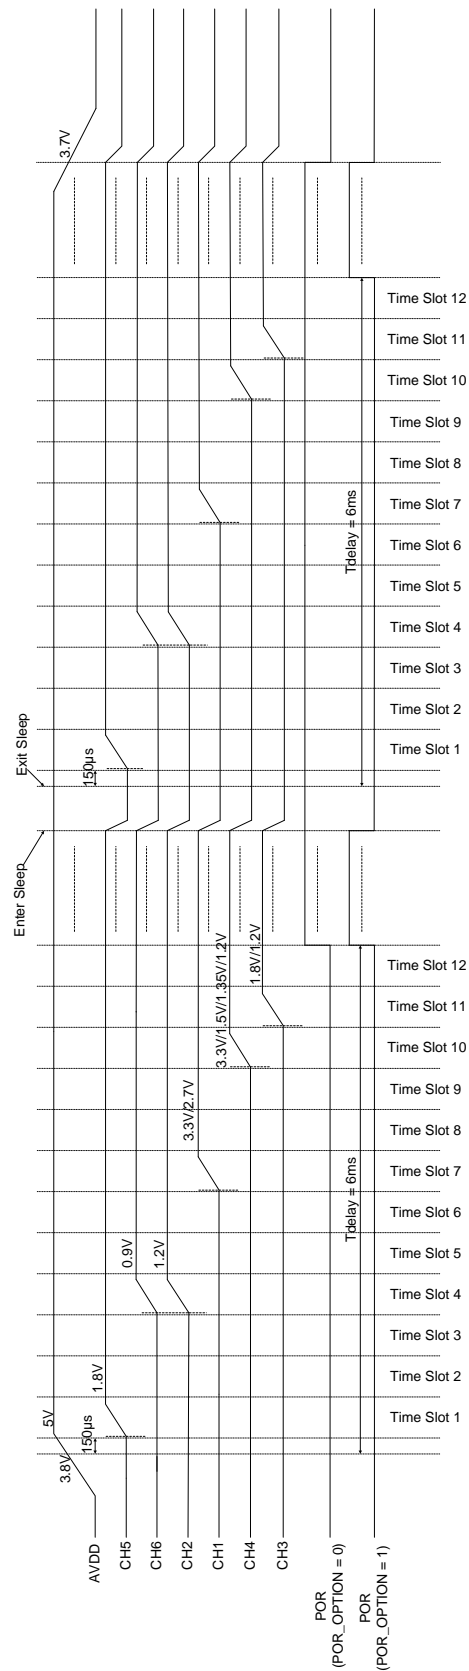

Figure 7. For example : Power On/Off Sequence and Sleep Off / Wake up Sequence with Different POR_OPTION on V_{IN} = 5V

Figure 8. For example : Power On/Off Sequence and Sleep off / Wake up Sequence with Different POR_OPTION on $V_{IN} = 3.3V$

Thermal Considerations

The junction temperature should never exceed the absolute maximum junction temperature $T_{J(MAX)}$, listed under Absolute Maximum Ratings, to avoid permanent damage to the device. The maximum allowable power dissipation depends on the thermal resistance of the IC package, the PCB layout, the rate of surrounding airflow, and the difference between the junction and ambient temperatures. The maximum power dissipation can be calculated using the following formula :

$$P_{D(MAX)} = (T_{J(MAX)} - T_A) / \theta_{JA}$$

where $T_{J(MAX)}$ is the maximum junction temperature, T_A is the ambient temperature, and θ_{JA} is the junction-to-ambient thermal resistance.

For continuous operation, the maximum operating junction temperature indicated under Recommended Operating Conditions is 125°C. The junction-to-ambient thermal resistance, θ_{JA} , is highly package dependent. For a WL-CSP-56B 3.19x3.59 (BSC) package, the thermal resistance, θ_{JA} , is 26°C/W on a standard JEDEC 51-7 high effective-thermal-conductivity four-layer test board. The maximum power dissipation at $T_A = 25^\circ\text{C}$ can be calculated as below :

$$P_{D(MAX)} = (125^\circ\text{C} - 25^\circ\text{C}) / (26^\circ\text{C/W}) = 3.84\text{W for a WL-CSP-56B 3.19x3.59 (BSC) package.}$$

The maximum power dissipation depends on the operating ambient temperature for the fixed $T_{J(MAX)}$ and the thermal resistance, θ_{JA} . The derating curves in Figure 9 allows the designer to see the effect of rising ambient temperature on the maximum power dissipation.
